

# TOPIC 15 – ENERGETICS

## 15.3: ENTROPY

IB Chemistry

T15D12

# 15.3 Entropy - 1.5 hours

- 15.3.1 **State** and **explain** the factors that increase the entropy in a system. (3)
- 15.3.2 **Predict** whether the entropy change ( $\Delta S$ ) for a given reaction or process is positive or negative. (3)
- 15.3.3 **Calculate** the standard entropy change for a reaction ( $\Delta S$ ) using standard entropy values(s) . (2)

# 15.3.1 - Entropy

- 15.3.1 **State** and **explain** the factors that increase the entropy in a system. (3)
- **Entropy** can be regarded as a measure of the disorder or dispersal of energy in a system
- The symbol is , **S**, and the disorder refers to the arrangement of particles (atoms, ions, etc) and the kinetic energies of the particles in a system
- For example, ionic solid vs gas. The gas has significantly greater entropy because its particles are moving rapidly in all directions

# 15.3.1 – Effect of T on Entropy

- When T is increased, disorder and hence entropy (S) increase.
- Particles vibrate more, move faster, etc.

# 15.3.1 – Effect of State Change

- The disorder of particles increases from solid to liquid to gas increasing entropy.
- The particle arrangement becomes more orderly when a change in state occurs from gas to liquid to solid, hence the entropy decreases

## 15.3.1 – Effect of change in amount

- If the number of particles increases, disorder and entropy increase.
- This is especially true of gases
  - $\text{N}_2\text{O}_4 (\text{g}) \rightarrow 2\text{NO}_2 (\text{g})$
- Conversely, the entropy decreases when the number for particles decreases,
  - $\text{CH}_2=\text{CH}_2 (\text{g}) + \text{H}_2 (\text{g}) \rightarrow \text{C}_2\text{H}_6 (\text{g})$

# 15.3.1 – Effect of mixing particles

- The mixing of particles increases disorder, resulting in an increase in entropy.
- If the two sets of particles have different average kinetic energies (diff Temps), then the kinetic energy is randomly dispersed in collisions until a new equilibrium temperature is attained
- Think of dissolving NaCl in a beaker of water, overall entropy will increase

## 15.3.2 – Entropy Change

- 15.3.2 **Predict** whether the entropy change ( $\Delta S$ ) for a given reaction or process is positive or negative. (3)
- By examination of the reactants and products, the **change in entropy** of a system can be predicted ( $\Delta S$ )
- If the products are more disordered than the reactants, then  $\Delta S_{\text{sys}}$  = positive
- If the products are less disordered than the reactants, then  $\Delta S_{\text{sys}}$  = negative

| Chemical reaction or physical change          | Entropy Change ( $\Delta S$ )                          | Example  |
|---|--|--|
| Melting                                       | Increase   | $\text{H}_2\text{O(s)} \rightarrow \text{H}_2\text{O(l)}$  |
| Boiling                                       | Large Increase   | $\text{H}_2\text{O(l)} \rightarrow \text{H}_2\text{O(g)}$  |
| Condensing                                    | Large Decrease   | $\text{H}_2\text{O(g)} \rightarrow \text{H}_2\text{O(l)}$  |
| Sublimation                                   | Very Large Increase                                    | $\text{I}_2\text{(s)} \rightarrow \text{I}_2\text{(g)}$  |
| Vapor Deposition                              | Very Large Decrease                                    | $\text{I}_2\text{(g)} \rightarrow \text{I}_2\text{(s)}$  |
| Freezing                                      | Decrease   | $\text{H}_2\text{O(l)} \rightarrow \text{H}_2\text{O(s)}$  |
| Dissolving a solute to form a solution        | Generally an Increase (except with highly charge ions) | $\text{NaCl(s)} + \text{(aq)} \rightarrow \text{NaCl(aq)}$   |
| Precipitation                                 | Large Decrease   | $\text{Pb}^{2+}\text{(aq)} + 2\text{Cl}^-\text{(aq)} \rightarrow \text{PbCl}_2\text{(s)}$          |
| Crystallization from a solution               | Decrease   | $\text{NaCl(aq)} \rightarrow \text{NaCl(s)}$   |
| Chemical Reaction: solid or liquid form gas   | Large Increase   | $\text{CaCO}_3\text{(s)} \rightarrow \text{CaO(s)} + \text{CO}_2\text{(g)}$                        |
| Chemical Reaction: gases form solid or liquid | Large Decrease   | $2\text{H}_2\text{S(g)} + \text{SO}_2\text{(g)} \rightarrow 3\text{S(s)} + 2\text{H}_2\text{O(l)}$ |
| Increase in # mol gas                         | Large Increase   | $2\text{NH}_3\text{(g)} \rightarrow \text{N}_2\text{(g)} + 3\text{H}_2\text{(g)}$                  |

# 15.3.3 – Standard Entropy Change

- 15.3.3 **Calculate** the standard entropy change for a reaction ( $\Delta S$ ) using standard entropy values(s) .  
(2)
- A change in entropy is represented by  $\Delta S$ 
  - **Units** of  $S$  and  $\Delta S = \text{ ——— } = \text{ ——— }$
- Entropy values are absolute values and can be measured experimentally (heat capacities)
- Value of  $\Delta S$  can be calculated from absolute values of entropies using the following expression

$$\Delta S^\theta = S^\theta_{[\text{products}]} - S^\theta_{[\text{reactants}]}$$

## 15.3.3 – Entropy Values

- Entropy values (under standard thermo conditions) for selected organic compounds are listed on pages 12 and 13 of the *Chemistry Data Booklet*.
- Example:
  - Calculate the entropy change that occurs during the complete combustion of ethane:
    - $\text{C}_2\text{H}_6(\text{g}) + 3 \frac{1}{2} \text{O}_2(\text{g}) \rightarrow 2\text{CO}_2(\text{g}) + 3\text{H}_2\text{O}(\text{l})$
    - $S^\theta_{[\text{C}_2\text{H}_6(\text{g})]} = 230 \text{ ———}$
    - $S^\theta_{[\text{O}_2(\text{g})]} = 205 \text{ ———}$
    - $S^\theta_{[\text{CO}_2(\text{g})]} = 214 \text{ ———}$
    - $S^\theta_{[\text{H}_2\text{O}(\text{g})]} = 70 \text{ ———}$

## 15.3.3 – Entropy Example

- From the previous slide and example
- The equation will be as follows
  - $\Delta S^\theta = S^\theta_{[\text{products}]} - S^\theta_{[\text{reactants}]}$
- $\Delta S^\theta = [(2 \times 214) + (3 \times 70)] - [230 + (3.5 \times 205)]$
- $\Delta S^\theta = -310 \text{ —}$
